This office action is in response to the reply filed on 12/30/2009.

Claims 1-3, 6-10 and 12-17 are pending in the application and have been examined.

3. This office action is being sent as a supplemental notice of allowance in order to correct a

minor deficiency in the abstract of the application.

Examiner's Amendment

4. Permission for the following amendment was received from Robert Crawford on

03/25/2010 Amend the abstract to read:

In a two-dimensional optical storage (TwoDOS) arrangement, at certain places on the optical

disc, calibration pits are placed, for instance in the lead-in and/or additionally sparsely in the

data. The signal waveform resulting from the read out of the calibration bits is measured, and

matrix multiplication is performed on these signals to obtain the linear interference coefficients.

This can be done since the bit sequence is known (along all of the bit-rows of the 2D patterns).

From these linear interference coefficients, the electric field distribution of the read-out spots at

the pitholes can be reconstructed. This information can be used in at least two ways: The signal

processing unit can use this as input for its settings, so it uses a measured response of the optical

channel instead of an expected response.
